Alright, Moving Letters for Welding…

There are a few ways to move letters within text using the Sure Cuts A Lot program, so that they overlap for welding. We will discuss 3 methods
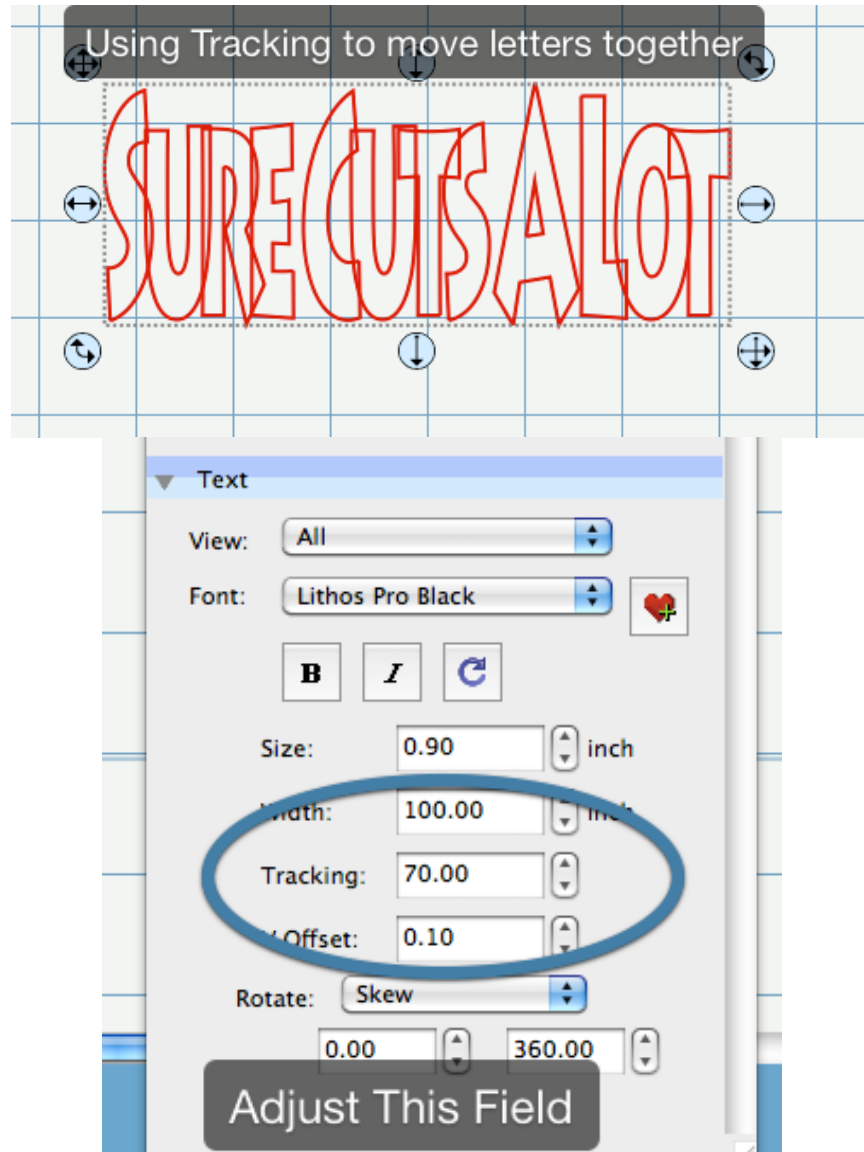

1. First we will Choose the Selection Tool from the Tools window. Next we will [click] on the text to select it on the mat. Just go to the Object menu and choose Ungroup. From there you can then move the individual letters around wherever you wish.

2. First we will choose the selection tool from the Tools window. Then we will [click] on the text that we wish adjust letter spacing. Then let us look at the "Properties Window," we should see a Text section. In the Text section window we can then change the Tracking field. This will alter the spacing between each letter. Decreasing the value will bring those letters closer together.

Using Tracking to move letters together

Text

View: All

Font: Lithos Pro Black

B *I* C

Size: 0.90 inch

Width: 100.00 inch

Tracking: 70.00

Offset: 0.10

Rotate: Skew

0.00   360.00

Adjust This Field

3. Choose the Text Tool from the Tools window. Click and drag over the letters you wish to change. The letters should be highlighted. In the Text section in the Properties window, you can change the Tracking field to adjust the letter spacing for the highlighted letters.
